PERFORMANCE INFORMATION SYSTEM

Relationship Officer Performance & Profitability Module

Consolidated Business Requirements, Calculations, Forms, Reports and Dashboard Requirements

---

Document status

Working requirements document prepared from client notes, the RO profitability workbook, the April MPR presentation, verbal explanations/recordings, and project discussions. Items that are not fully supported by the source materials are explicitly marked for client confirmation.

Confidential

For internal review and requirements clarification

Executive Summary

The Relationship Officer (RO) Performance & Profitability module is one component of the wider Performance Information System. It converts the organisation's current RO reporting process - presently represented through profitability spreadsheets, Monthly Performance Report (MPR) presentations and manual explanations - into a structured system that can calculate performance automatically and allow officers and management to monitor progress daily.

The module links each RO to customers, products, investments/transactions, targets and budgets. It then calculates the financial and performance metrics required for profitability, account-opening performance, balance-sheet/portfolio position, target achievement and run-rate tracking.

> **Core business question**
>
> At any point, an RO should be able to answer: What is my target? Where am I now? How much have I achieved? How much remains? What must I achieve daily or monthly to meet the target?

Document Structure

1. Module purpose and users
2. Master data, forms and business setup
3. Budgets, targets and account-opening requirements
4. Investment/deal data and financial terminology
5. Profitability calculation engine and verified formulas
6. RO position, gap and run-rate calculations
7. Daily, MTD and YTD performance tracking
8. Dashboards and reports
9. Data ownership and system architecture principles
10. Formula register and verified Excel mappings
11. Worked example
12. Items requiring client confirmation before final development sign-off

1. Module Purpose and Scope

The RO module is designed to measure how each Relationship Officer performs based on the customers and business assigned to that officer. It is not the whole Performance Information System; it is one financial-services performance module within the wider platform.

The current MPR reporting structure identifies three major RO reporting areas:

- RO Profitability Summary
- YTD Account Opening Summary
- RO Position Summary

The new system should automate these existing reports and extend them with daily visibility, product-level analysis, drill-downs and historical trends.

1.1 Questions the Module Must Answer

- Which customers belong to each RO?
- How much business has each RO brought or retained?
- Which products contribute to the RO portfolio?
- What customer interest rate applies to each deal?
- What pool rate applies and what spread does it create?
- What interest expense, interest income, margin and profitability are generated?
- How many accounts has the RO opened versus budget?
- What is the RO current portfolio/balance-sheet position versus target?
- What gap remains and what monthly/daily run rate is required?
- Is the RO ahead of or behind target today?

2. Users and Access

User	Typical View	Key Information
Relationship Officer	Own portfolio only	Customers, transactions, products, targets, daily/MTD/YTD performance, profitability and run rate
Manager / Team Head	ROs under the manager	RO comparison, team totals, exceptions, targets, product and customer drill-down
Executive / Management	Consolidated organisation scope	Division/region/team performance, profitability, trends, target achievement and exceptions
Administrator / Performance Team	System configuration	ROs, customer assignments, products, budgets, pool rates, organisational structure and approved calculation settings

3. Required Master Data and Forms

3.1 Relationship Officer Master

Field	Purpose
RO ID	Unique system identifier
Employee/Staff ID	Internal staff number
RO Name	Officer name
Team	Assigned team
Division	Business division
Branch/Location	Location where applicable
Manager	Reporting manager
Start Date	Effective assignment date
Status	Active / Inactive

3.2 Customer Master

Field	Purpose
Customer ID	Unique customer identifier
Customer Name	Customer or business name
Customer Type	Individual, corporate or approved category
Account Number / Reference	Source-system account/reference where applicable
Product	Product used by the customer
Status	Active / Inactive
Date Created	Customer/account creation date

3.3 RO-to-Customer Assignment

The system must maintain a clear mapping between each Relationship Officer and the customers assigned to that officer. This mapping drives portfolio, transaction, product, target and profitability attribution.

RO	Customer	Effective From	Effective To / Status
RO A	Customer 1	Assignment date	Current
RO A	Customer 2	Assignment date	Current
RO B	Customer 3	Assignment date	Current

> **History should be preserved**
>
> If a customer moves from one RO to another, the new assignment should not erase the historical performance that belonged to the previous RO.

3.4 Product Master

Products should be configurable so targets, budgets, transactions and profitability can be analysed by product.

- Product ID
- Product name
- Product category
- Status
- Applicable rules
- Pool rate or pool-rate mapping where relevant
- Product target/budget

4. Budgets, Targets and Account-Opening Requirements

4.1 Annual Budget / Target Form

Management should be able to enter whole-year budgets and targets. The system should then split or allocate those targets into approved reporting periods.

- Annual portfolio/balance-sheet target
- Annual inflow target
- Annual account-opening target
- Product-specific target
- Profitability target where applicable

4.2 Automatic Budget Splitting

Equal monthly target: **Monthly Target = Annual Target / 12**
Use only if the client approves equal monthly distribution.

Equal quarterly target: **Quarterly Target = Annual Target / 4**
Use only if the client approves equal quarterly distribution.

The system should also support manually configured monthly or seasonal distributions because business targets may not be equal across all months.

Month	Illustrative Target
January	NGN 80m
February	NGN 90m
March	NGN 110m
...	...
December	NGN 150m

4.3 Product-Level Budget

Product	Annual Budget
Product A	NGN 500m
Product B	NGN 300m
Product C	NGN 400m
Total	NGN 1.2bn

Product target share: **Product Target Share (%) = Product Target / Total Annual Target x 100**

4.4 Account-Opening Target

The organisation also budgets the number of accounts each RO should open. The system should track daily, month-to-date and year-to-date actuals against the approved account-opening target.

Accounts opened today: **Count(accounts opened today)**

MTD accounts: **Count(accounts opened from start of current month to today)**

YTD accounts: **Count(accounts opened from 1 January to today)**

Remaining accounts: **Annual Account Target - YTD Accounts**

Account achievement: **YTD Accounts / Annual Account Target x 100**

4.5 Account-Opening Run Rate Observed in the Existing MPR

The April MPR sample contains a run-rate pattern that can be reproduced from the displayed values as follows:

Observed account run rate: **((3 x Displayed Target) - YTD Actual) / 8**

Example: Displayed Target = 80 and YTD Actual = 52:

Example: **((3 x 80) - 52) / 8 = 188 / 8 = 23.50**

A second example also reconciles: Displayed Target = 66 and YTD Actual = 61 gives (198 - 61) / 8 = 17.125, displayed as 17.13.

Client confirmation required

The observed pattern suggests the displayed target may represent a four-month target and the annual target may be Displayed Target x 3. This interpretation reproduces the sample MPR but should be confirmed before it becomes a system rule.

5. Investment / Deal Data Required for Profitability

The profitability workbook shows the information required at customer/deal level. The system should capture or import the base transaction data and calculate the derived fields automatically.

Field	Business Meaning
Customer Name	Customer linked to the RO
Inflow / Rollover	Business amount recorded in the workbook
Calculation Base (unlabelled source column)	Amount used by the workbook for monthly interest expense and interest income; official business meaning still requires confirmation
Interest Rate per Annum	Rate paid/accrued to the customer
Pool Rate	Internal rate used to value the funds
Effective Date	Date the investment becomes active
Weight	Customer share of the relevant total inflow portfolio
WACC Contribution	Customer rate multiplied by customer weight
Tenor	Investment duration in days
Maturity Date	Effective date plus tenor
Tenor Interest	Interest calculated over the full tenor
Previous Month-End	Previous reporting cut-off
Current Month-End	Current reporting cut-off
Applicable Days	Number of days used for the reporting-period interest calculation
Monthly Interest Expense	Customer interest cost for the reporting period
Interest Income	Pool-rate income for the reporting period
Maturity Balance	Inflow plus tenor interest in the current workbook
Current Balance	Inflow plus current-month interest expense in the current workbook
Margin	Interest income less interest expense at deal level

5.1 New Inflow and Rollover

New inflow represents new money/business brought into the organisation. Rollover represents an existing investment that reaches maturity and is renewed. The system should keep these categories distinct because management may want to separate new business generation from retained/renewed business.

Recommended transaction history

A rollover should preferably create a new linked transaction while retaining the original deal history, subject to client confirmation.

5.2 Effective Date, Tenor and Maturity Date

Maturity date: **Effective Date + Tenor**

Tenor is expressed in days in the source workbook. Examples may include 30, 90, 180 or 365 days.

5.3 Customer Interest Rate and Pool Rate

The customer interest rate is expressed per annum and represents the rate payable/accrued to the customer. The pool rate is the internal rate used to determine the income/value attributed to those funds. The source workbook contains examples using a 24% pool rate, but this should be configurable rather than hard-coded.

- Pool rate value
- Effective-from date
- Effective-to date
- Product
- Tenor band where applicable
- Currency where applicable

6. Profitability Calculation Engine

6.1 Customer Weight

Weight: **Customer Inflow / Total Inflow**

Example: Customer Inflow = NGN 20,000,000 and Total Inflow = NGN 42,900,000.

Example: **20,000,000 / 42,900,000 = 0.466200466 = 46.62%**

6.2 WACC / Weighted Rate Contribution

Weighted Rate Contribution: **Customer Interest Rate x Customer Weight**

Example: Customer Rate = 20% and Weight = 46.62%.

Example: **20% x 46.62% = 9.324%**

Portfolio WACC / Weighted Rate: **Sum of all (Customer Rate x Customer Weight)**

The August sample produces approximately 18.11%.

> **Terminology note**
>
> The client workbook uses the term WACC. The observed formula is a weighted average customer/funding rate based on portfolio weights. The user-facing term can remain WACC until the client approves the formal definition.

6.3 Pool Spread

Pool spread: **Pool Rate - WACC**

August sample: **24% - 18.111888% = 5.888112% (approximately 5.89%)**

6.4 Tenor Interest

Tenor interest: **Inflow x Customer Rate x Tenor / 365**

Example: Inflow = NGN 20m, Rate = 20%, Tenor = 365 days.

Example: 20,000,000 x 20% x 365 / 365 = NGN 4,000,000

6.5 Maturity Balance

Maturity balance: Inflow + Tenor Interest

Example: NGN 20,000,000 + NGN 4,000,000 = NGN 24,000,000

6.6 Applicable Days in the Reporting Period

The source workbook uses the reporting date, previous month-end and effective date to determine how many days belong to the reporting period. The currently observed pattern can be generalised as:

Observed applicable-days pattern: Current Month-End - MAX(Previous Month-End, Effective Date)
This reflects the examples reviewed. Maturity within the reporting month still requires an approved rule.

Effective Date	Reporting Date	Observed Days
29 Aug	31 Aug	2
28 Aug	31 Aug	3
13 Aug	31 Aug	18

Date convention requires confirmation

The samples effectively exclude the effective date in these examples. The client should confirm whether the effective date itself earns interest and how maturity inside the month should cap the day count.

6.7 Monthly Interest Expense

Interest expense: Calculation Base x Customer Interest Rate x Applicable Days / 365

Example from the workbook: Calculation Base = NGN 23.6m, Customer Rate = 20%, Days = 2.

Example: 23,600,000 x 20% x 2 / 365 = NGN 25,863.01

The recordings describe this as the interest cost paid/accrued to customers. From the RO/business perspective, it is an expense.

6.8 Interest Income

Interest income: Calculation Base x Pool Rate x Applicable Days / 365

Example: Calculation Base = NGN 23.6m, Pool Rate = 24%, Days = 2.

Example: 23,600,000 x 24% x 2 / 365 = NGN 31,035.62

6.9 Deal-Level Margin

Deal margin: Interest Income - Interest Expense

Example: NGN 31,035.62 - NGN 25,863.01 = NGN 5,172.60

Equivalent expression: Calculation Base x (Pool Rate - Customer Rate) x Applicable Days / 365

6.10 Current Balance in the Source Workbook

Current balance: **Inflow + Current-Month Interest Expense**

This is the formula currently used in the workbook. Its exact business meaning should be validated if the production source database already provides an authoritative current account/investment balance.

6.11 Withholding Tax (WHT)

The management profitability presentation contains WHT. The reviewed figures behave as approximately 10% of interest income:

Observed WHT: **Interest Income x 10%**

Example: **NGN 10.283m x 10% = approximately NGN 1.028m**

Reconciliation issue

The customer-level Excel margin is Interest Income - Interest Expense, while the management MPR presentation also deducts WHT. The final official system definition must be confirmed.

6.12 Management Margin and Final Profitability

Observed MPR margin: **Interest Income - WHT - Interest Expense**

Observed profitability: **Margin - Total OPEX**

Example from the MPR: Interest Income = NGN 10.283m, WHT = NGN 1.028m, Interest Expense = NGN 8.822m.

MPR margin example: **10.283m - 1.028m - 8.822m = approximately NGN 0.433m**

If Total OPEX = NGN 1.049m:

Profitability example: **0.433m - 1.049m = approximately -NGN 0.616m**

A negative profitability result indicates that the margin generated is not sufficient to cover the allocated operating expenses for that reporting calculation.

6.13 OPEX Requirement

The source materials show OPEX being deducted from margin, but they do not fully define the allocation method. The system therefore needs an approved OPEX rule. Possible components may include direct RO cost, team/shared cost, departmental overhead and other approved operating expenses.

6.14 Complete Profitability Calculation Chain

13. Weight = Customer Inflow / Total Inflow.
14. Weighted Rate Contribution = Customer Rate x Weight.
15. WACC = Sum of all weighted rate contributions.
16. Pool Spread = Pool Rate - WACC.
17. Applicable Days = reporting-period day count based on effective date and cut-off dates.
18. Interest Expense = Calculation Base x Customer Rate x Days / 365.
19. Interest Income = Calculation Base x Pool Rate x Days / 365.
20. Deal Margin = Interest Income - Interest Expense.
21. WHT = Interest Income x approved WHT rate, where applicable.
22. Management Margin = Interest Income - WHT - Interest Expense, subject to final confirmation.
23. Profitability = Management Margin - OPEX.

7. RO Position / Balance-Sheet Performance

The RO Position report measures the officer current business position against the approved target and determines the gap and required run rate.

Position gap: **Target - Current Position**

Position achievement: **Current Position / Target x 100**

Remaining percentage: **100% - Achievement %**

Example: Target = NGN 3.5bn and Current Position = NGN 528.67m.

Gap example: **3.5bn - 528.67m = NGN 2.97133bn**

Achievement example: **528.67m / 3.5bn x 100 = approximately 15.10%**

7.1 Monthly Position Run Rate

Monthly run rate: **Gap / Remaining Months**

For an April report there are eight months remaining after April. Using the sample gap:

Example: **NGN 2.97133bn / 8 = approximately NGN 371.416m per month**

8. Daily Performance Tracking

A major requirement is that the RO should not wait for the monthly MPR to understand performance. The system should provide a daily view of position, activity, target progress and profitability.

8.1 Daily Required Run Rate

Daily run rate: **Remaining Target / Remaining Applicable Days**

The client should confirm whether Applicable Days means calendar days or working/business days.

Example: Remaining target = NGN 100m and 20 applicable working days remain:

Example: **NGN 100m / 20 = NGN 5m per day**

If the RO brings in NGN 20m the next day, the remaining target becomes NGN 80m. With 19 working days remaining:

Recalculated daily run rate: **NGN 80m / 19 = approximately NGN 4.21m per day**

8.2 Daily Event Metrics

- Accounts opened today
- New inflow today
- Rollover today
- Maturity today
- Liquidation/withdrawal today
- New customers today

8.3 Daily Accrual Metrics

Existing investments continue to accrue values even when no new event occurs. The system can therefore maintain an as-of-today financial view.

Daily interest expense: Calculation Base x Customer Rate x 1 / 365

Daily interest income: Calculation Base x Pool Rate x 1 / 365

Daily interest margin: Daily Interest Income - Daily Interest Expense

8.4 Month-to-Date and Year-to-Date Metrics

MTD inflow: Sum of inflows in the current month

MTD rollover: Sum of rollovers in the current month

MTD accounts: Count of accounts opened in the current month

MTD interest income: Sum of current-month interest income

MTD interest expense: Sum of current-month interest expense

YTD inflow: Sum of inflows from 1 January to today

YTD rollover: Sum of rollovers from 1 January to today

YTD accounts: Count of accounts opened from 1 January to today

YTD profitability: Sum of approved profitability values from 1 January to today

8.5 Daily Performance Snapshot

Because daily history is required, the platform should retain a dated snapshot or equivalent historical dataset containing at least:

- Date
- RO
- Portfolio position
- Annual target
- Gap
- Achievement %
- Daily run rate
- MTD/YTD inflow
- Accounts today / MTD / YTD
- Interest income
- Interest expense
- WACC
- Margin
- OPEX
- Profitability

9. Dashboards and Reports

9.1 Relationship Officer Dashboard

Area	Key KPIs / Information
Portfolio	Current Portfolio, Annual Target, Achievement %, Gap, Monthly Run Rate, Daily Run Rate

Area	Key KPIs / Information
Account Opening	Accounts Today, MTD Accounts, YTD Accounts, Target, Remaining Accounts, Achievement %, Required Pace
Business Activity	New Inflow Today, MTD/YTD Inflow, Rollovers, Maturities, Liquidations
Profitability	Interest Income, Interest Expense, WHT where displayed, Margin, OPEX, Profitability, WACC, Pool Rate, Spread

9.2 Recommended RO Charts

- Target vs Actual
- Daily progress trend
- Account-opening trend
- Profitability trend
- Inflow vs Rollover
- Product contribution

9.3 Manager Dashboard

The manager should see all assigned ROs in one comparable view and be able to drill down from manager to RO, customer, product and transaction.

RO	Current Position	Target	Achievement	Gap	Accounts	WACC	Profitability
RO A	...	...	...	...	...	...	...
RO B	...	...	...	...	...	...	...

9.4 Product Performance

Product achievement: **Product Actual / Product Target x 100**

Product gap: **Product Target - Product Actual**

Product contribution: **Product Actual / Total Actual x 100**

9.5 Profitability Report

The profitability report should contain, where applicable:

- RO
- Customer
- Product
- Inflow/Rollover
- Calculation Base
- Customer Interest Rate
- Pool Rate
- Effective Date
- Weight
- WACC Contribution
- Tenor
- Maturity Date
- Tenor Interest
- Previous Reporting Date
- Current Reporting Date
- Applicable Days
- Monthly Interest Expense
- Interest Income
- Maturity Balance
- Current Balance

- Margin
- WHT
- OPEX
- Final Profitability

Recommended filters: date, RO, customer, product, manager, branch, division and team.

9.6 Account-Opening Report

- RO
- Product
- Annual Account Target
- Period Target
- Accounts Opened Today
- MTD Accounts
- YTD Accounts
- Gap
- Achievement %
- Monthly Run Rate
- Daily Required Run Rate

9.7 RO Position Report

- RO
- Target
- Current Balance-Sheet Position
- Achievement %
- Gap
- Monthly Run Rate
- Daily Run Rate
- Inflows
- Rollovers
- Maturities
- Product Breakdown

9.8 Maturity / Rollover Report

- Investments maturing today
- Investments maturing this week
- Investments maturing this month
- Matured investments
- Rolled-over investments
- Matured investments not rolled over

10. Aggregation and Data Architecture Rules

10.1 Calculate at the Lowest Meaningful Level

The safest approach is to calculate financial values at customer/deal level and then aggregate upward to RO, team, division and organisation. This avoids maintaining different financial formulas for each management level.

Team inflow: **Sum of RO Inflows**

Team interest income: **Sum of RO Interest Income**

Team profitability: **Sum of RO Profitability**

> **Weighted-rate exception**
>
> WACC/weighted rates must be recalculated from underlying amounts and rates. They should not be calculated as a simple average of RO WACC values.

Team weighted rate: **Sum(Customer Amount x Customer Rate) / Sum(Customer Amount)**

10.2 Manual Configuration vs Source-System Data

Category	Examples
Configuration / Manual Setup	RO list, customer-to-RO mapping, products, annual budgets, account-opening targets, product budgets, pool rates, OPEX rules, organisational structure
Source-System Data	Customer information, accounts, balances, transactions, effective dates, products, investments, maturity details, inflows and rollovers
Automatically Calculated	Weight, WACC, spread, maturity date, tenor interest, applicable days, interest expense, interest income, margin, WHT, profitability, achievement, gap, run rates, MTD and YTD totals

10.3 Calculation Engine Must Be Separate from the Dashboard

The approved business formulas should not exist only inside Apache Superset charts. A central calculation/KPI layer should produce the approved metrics, and the dashboard should present those results.

Conceptual flow: Raw Data -> Approved Calculation/KPI Engine -> Reporting Dataset -> Apache Superset Dashboard.

> **Why this matters**
>
> There should be one definition of Profitability, one definition of WACC, one definition of Margin and one definition of Run Rate. This prevents different dashboards from producing different answers for the same metric.

11. Formula Register

Metric	Formula	Status / Source Interpretation
Weight	Customer Inflow / Total Inflow	Verified from workbook
Weighted Rate Contribution	Customer Rate x Weight	Verified from workbook
WACC	Sum of Weighted Rate Contributions	Verified from workbook
Pool Spread	Pool Rate - WACC	Verified from workbook
Maturity Date	Effective Date + Tenor	Verified from workbook
Tenor Interest	Inflow x Customer Rate x Tenor / 365	Verified from workbook
Maturity Balance	Inflow + Tenor Interest	Verified from workbook
Applicable Days	Current Month-End - MAX(Previous Month-End, Effective Date)	Observed pattern; maturity rule needs confirmation
Monthly Interest Expense	Calculation Base x Customer Rate x Days / 365	Verified from workbook
Interest Income	Calculation Base x Pool Rate x Days / 365	Verified from workbook
Deal Margin	Interest Income - Interest Expense	Verified from workbook
Current Balance	Inflow + Current-Month Interest Expense	Verified workbook formula; business meaning needs confirmation
WHT	Interest Income x approximately 10%	Observed in MPR sample; confirm official rule
MPR Margin	Interest Income - WHT - Interest Expense	Reconciles MPR sample; confirm official system definition
Profitability	Margin - OPEX	Reconciles MPR sample
Position Gap	Target - Current Position	Reconciles MPR sample
Position Achievement %	Current Position / Target x 100	Standard derived KPI
Position Monthly Run Rate	Gap / Remaining Months	Reconciles MPR sample
Account Achievement %	YTD Accounts / Annual Account Target x 100	Required derived KPI
Remaining Accounts	Annual Account Target - YTD Accounts	Required derived KPI
Observed Account Run Rate	((3 x Displayed Target) - YTD Actual) / 8	Reproduces April MPR sample; interpretation needs confirmation
Daily Run Rate	Remaining Target / Remaining Applicable Days	New daily-tracking requirement; day basis needs confirmation
Product Achievement %	Product Actual / Product Target x 100	Required derived KPI
Product Gap	Product Target - Product Actual	Required derived KPI

12. Verified Excel Formula Mapping

The following formulas were directly reconstructed from the RO profitability workbook structure and are important for development traceability.

Workbook Field	Excel-Style Mapping	Business Meaning
Weight	H3 = B3 / B$15	Individual inflow divided by total inflow
WACC Contribution	G3 = D3 x H3	Customer rate multiplied by weight
Maturity Date	J3 = F3 + I3	Effective date plus tenor
Tenor Interest	K3 = B3 x D3 x I3 / 365	Full-tenor interest
Applicable Days	N3 = Reporting Date - Effective Date (for in-month starts)	Observed day-count example
Monthly Interest Expense	O3 = C3 x D3 x N3 / 365	Uses unlabelled Column C as calculation base
Interest Income	P3 = E3 x C3 x N3 / 365	Pool rate x calculation base x days / 365
Maturity Balance	Q3 = B3 + K3	Inflow plus tenor interest
Current Balance	R3 = B3 + O3	Inflow plus current-month interest expense
Margin	S3 = P3 - O3	Interest income less interest expense
Total WACC	SUM(G3:G12)	Sum of individual weighted-rate contributions
Pool Spread	Pool Rate - Total WACC	Difference between pool rate and weighted rate

12.1 Critical Unresolved Field - Unlabelled Calculation Base

The workbook contains an unlabelled amount column (referred to in this document as the Calculation Base). It is directly used in both monthly interest expense and interest income formulas. Its official business meaning must be confirmed before the financial engine is finalised.

- Possible rolled principal
- Possible maturity amount from a prior placement
- Applicable investment balance
- Carried-forward balance
- Another business-defined value

Blocking clarification

Because this field directly changes interest expense, interest income and margin, developers should not guess its meaning.

13. Worked End-to-End Example

Assume management creates the following RO target and one customer investment:

Item	Value
RO	John
Annual Portfolio Target	NGN 1.2bn
Annual Account Target	120 accounts
Customer Inflow	NGN 20m
Customer Rate	20% per annum
Pool Rate	24% per annum
Calculation Base	NGN 23.6m
Applicable Days	2

Interest expense: **23,600,000 x 20% x 2 / 365 = NGN 25,863.01**

Interest income: **23,600,000 x 24% x 2 / 365 = NGN 31,035.62**

Deal margin: **31,035.62 - 25,863.01 = NGN 5,172.60**

If John current portfolio becomes NGN 800m:

Achievement: **800m / 1.2bn x 100 = 66.67%**

Gap: **1.2bn - 800m = NGN 400m**

If four months remain:

Monthly run rate: **NGN 400m / 4 = NGN 100m per month**

If 80 applicable working days remain:

Daily run rate: **NGN 400m / 80 = NGN 5m per day**

Business outcome

John can immediately see that 66.67% of the target has been achieved, NGN 400m remains, and the required pace is approximately NGN 100m per month or NGN 5m per applicable working day.

14. Items Requiring Client Confirmation Before Final Development Sign-Off

24. What is the official business meaning of the unlabelled Calculation Base (Column C) in the profitability workbook?
25. Is the official system margin Interest Income - Interest Expense, or Interest Income - WHT - Interest Expense? Are these two different reporting levels?
26. Is WHT always 10% of interest income, or is the rate/configuration different by product or transaction?
27. Exactly which OPEX items are included and how are they allocated to an RO?
28. Does every applicable product use a 365-day basis?
29. Does the effective date itself earn interest?
30. How should applicable days be capped when maturity happens before the reporting month-end?
31. Who sets the pool rate, how often does it change, and can it vary by product, tenor or currency?
32. Should historical pool-rate versions be retained for reproducible historical reports?
33. Is Inflow/Rollover the official weighting base used for WACC in all cases?
34. How should an annual budget be split: equally, quarterly, seasonally or by configured monthly values?
35. Does the Account Opening TARGET displayed in the April MPR represent a four-month target, explaining the x3 annualisation observed in the run-rate formula?
36. Should daily run rate use calendar days or working/business days?
37. How should early liquidation/termination affect interest, position and profitability?
38. How should partial withdrawals affect the calculation base and future accrual?
39. How should customer top-ups be classified: new inflow, new deal or increase to an existing deal?
40. Should each rollover create a new linked transaction while retaining the original transaction history?

15. Final Business Summary

The RO Performance & Profitability module should transform the current manual RO reporting process into an automated, daily performance system.

The organisation configures: ROs + Customers + RO/Customer Mapping + Products + Budgets + Account Targets + Pool Rates + OPEX Rules.

The organisation supplies or imports: Transactions + Balances + Investment/Deal Data + Effective Dates + Rates + Maturity Information.

The system calculates: Weights + WACC + Pool Spread + Tenor Interest + Maturity Dates + Monthly Interest Expense + Interest Income + Margin + WHT + Profitability + Current Position + Achievement + Gaps + Run Rates + Product Performance.

The system presents: RO Daily Dashboard + Manager Dashboard + Profitability Report + Account-Opening Report + RO Position Report + Product Report + Maturity/Rollover Report + Executive View.

Core outcome

The RO should no longer wait for an end-of-month MPR presentation to understand performance. At any time, the officer should be able to see the current position, target, achievement, remaining gap and required daily/monthly pace.

Source Materials Reviewed

- Client handwritten notes/screenshots explaining RO profitability and reporting concepts.

- RO profitability Excel workbook used to demonstrate calculations.
- April RO Monthly Performance Report presentation covering profitability, account opening and RO position.
- Client verbal explanations/recordings covering weighting/WACC, interest calculations and monthly reporting logic.
- Management Performance & Analytics Platform product discussion document.
- Additional requirements supplied during discussion, including daily RO progress tracking, annual budgets, product budgets and account-opening targets.

This is a working requirements document. Formulae labelled as verified reproduce the source workbook or MPR samples reviewed. Formulae or business meanings explicitly marked for confirmation should not be treated as final production rules until the client approves them.
